

ABSTRACT OF THE DISCLOSURE

A storage control apparatus controls physical disks according to the host access using a pair of controllers, while mirroring processing is decreased when data is written
5 to a cache memory and high-speed operation is enabled. The mirror management table is created with allocating the mirror area of the cache memory of the other controller, and acquisition of a mirror page of the cache memory of the other controller is executed referring to the mirror management
10 table without an exchange of mirror page acquisition messages between the controllers.
